(54) Title: USE OF MoO<sub>3</sub> AS CORROSION INHIBITOR, AND COATING COMPOSITION CONTAINING SUCH AN IN-  
HIBITOR

(57) Abstract: The subject of the invention is the user of MoO<sub>3</sub> as a corrosion inhibitor, and an anti-corrosion coating composition for metal parts, characterized in that it comprises: - at least one particulate metal; - an organic solvent; - a thickener; - a silane-based binder, preferably carrying epoxy functional groups; - molybdenum oxide (MoO<sub>3</sub>); - possibly a silicate of sodium, potassium or lithium, and; - water.

WO 02/38686 A2

"USE OF  $\text{MoO}_3$  AS CORROSION INHIBITOR, AND COATING COMPOSITION  
CONTAINING SUCH AN INHIBITOR"

The object of the present invention is to develop an  
5 anti-corrosion coating for metal parts, preferably a coating  
free of hexavalent chromium, which is endowed with improved  
anti-corrosion properties.

The invention applies to metal parts of any type, in  
10 particular made of steel or cast iron, which need to have  
good corrosion behaviour, for example because of their  
application in the motor-vehicle industry. The geometry of  
the parts to be treated is of little importance as long as  
the anti-corrosion compositions may be applied by reliable  
15 and industrializable processes.

One of the objects of the present invention is in particular  
to improve the anti-corrosion properties of parts treated  
without using a composition based on hexavalent chromium in  
20 the formulation of the coatings.

Many anti-corrosion treatment solutions based on hexavalent  
chromium have been proposed to date. Although they are  
generally satisfactory with regard to the protection of  
25 treated metal parts, they are, however, becoming increasingly  
criticized because of their consequences with regard to the  
toxic risks that they entail and in particular because of  
their adverse consequences for the environment.

30 As a consequence, various anti-corrosion treatment  
compositions free of hexavalent chromium have been  
recommended. Some of these compositions are based on a  
particular metal, such as zinc or aluminium. However, when  
such compositions are in the form of an aqueous dispersion  
35 their stability is limited. This precludes long preservation  
and storage times.

- 2 -

Within the context of the present invention, the Applicant has discovered that it is possible to improve the anti-corrosion properties and the stability of various anti-corrosion coating compositions by incorporating  
5 thereinto molybdenum oxide  $\text{MoO}_3$  as corrosion inhibitor.

Hitherto, the use of molybdenum oxide  $\text{MoO}_3$  as a corrosion inhibitor in systems of aqueous phase has not been known. Certain molybdates, i.e.  $\text{MoO}_4^{2-}$  ions, have already been  
10 presented as corrosion inhibitors. However, the Applicant has been able to show that in a certain number of conventional anti-corrosion compositions the addition of a molybdate, for example zinc molybdate, in no way improves its properties.

15 The present invention relates more particularly to the use of molybdenum oxide  $\text{MoO}_3$  as an agent for enhancing the anti-corrosion properties of a coating composition based on a particulate metal containing zinc or a zinc alloy in aqueous phase. This finding has even been extended to composition  
20 containing hexavalent chromium. This is another object of the invention.

Without in any way wishing to be limited to such an interpretation, it seems that in the particular case of an  
25 anti-corrosion coating composition based on a particulate metal, the presence of molybdenum oxide  $\text{MoO}_3$  makes it possible to improve the control of the sacrificial protection exerted by the particulate metal in suspension in the composition.

30 According to one particular feature, the particulate metals have a lamellar form, the thickness of the flakes being comprised between  $0,05 \mu\text{m}$  and  $1 \mu\text{m}$  and having a diameter equivalent ( $D_{50}$ ) measured by laser diffraction comprised between  $5 \mu\text{m}$  and  $25 \mu\text{m}$  the subject of the invention is more  
35 particularly the use of molybdenum oxide  $\text{MoO}_3$  in a composition containing zinc in aqueous phase.

According to another feature of the invention, the molybdenum

- 3 -

oxide  $\text{MoO}_3$  is used in an essentially pure orthorhombic crystalline form, having a molybdenum content greater than approximately 60% by mass.

5 Advantageously, the molybdenum oxide  $\text{MoO}_3$  will be used in the anti-corrosion compositions in the form of particles having dimensions of between 1 and 200  $\mu\text{m}$ .

More specifically, the subject of the present invention is anti-corrosion coating compositions for metal parts, which  
10 comprise:

- at least one particulate metal;
- an organic solvent;
- a thickener;
- a silane-based binder, preferably carrying epoxy  
15 functional groups;
- molybdenum oxide ( $\text{MoO}_3$ );
- possibly a silicate of sodium, potassium or lithium, and ;
- water.

20

The relative proportions of the various constituents in such a composition may vary widely. However, it has turned out that the content of molybdenum oxide  $\text{MoO}_3$  is preferably between 0.5 and 7% and even more preferably in the region of  
25 2% by weight of the total composition.

The particulate metal present in the composition may be chosen from zinc, aluminium, chromium, manganese, nickel, titanium, their alloys and intermetallic compounds, and  
30 mixtures thereof. It should be pointed out here that if the recommended coating composition is preferably free of  $\text{Cr}^{\text{VI}}$ , it may nevertheless contain a certain proportion of metallic chromium. In practice, it has turned out that the presence of zinc is highly desirable.

35

Advantageously, the particulate metal content is between 10% and 40% by weight of metal with respect to the weight of the composition.

- 4 -

Preferably, the anti-corrosion coating composition according to the invention contains zinc and/or aluminium, and preferably comprises zinc.

5 As indicated above, this type of composition is mainly of aqueous nature and therefore preferably contains from 30% to 60% by weight of water. The composition may nevertheless be enriched by the presence of an organic solvent, preferably a water-soluble organic solvent, which makes it possible to  
10 improve the anti-corrosion performance of the composition. For this purpose, the composition will contain, for example, from 1% to 30% by weight with respect to the total composition. However, it seems to be important not to exceed this organic solvent content of approximately 30%.

15 In an advantageous embodiment of the invention, the composition will make use of an organic solvent, for example consisting of a glycol ether, in particular diethylene glycol, triethylene glycol and dipropylene glycol.

20 According to another feature of the present invention, the anti-corrosion composition also contains from 0.005% to 2% by weight of a thickening agent, in particular of a cellulose derivative, more particularly hydroxymethylcellulose,  
25 hydroxyethylcellulose, hydroxypropylcellulose, hydroxypropylmethylcellulose, xanthan gum or an associative thickener of the polyurethane or acrylic type.

The composition of the present invention may also contain  
30 mineral rheologic agents of the silica or organophilic clays type.

Such a composition also makes use of a binder, preferably an organofunctional silane, used in an amount of 3% to 20% by  
35 weight. The organofunctionality can be represented by vinyl, methacryloxy and amino, but is preferably epoxy functional for enhanced coating performance as well as composition stability. The silane is advantageously easily dispersible in

- 5 -

aqueous medium, and is preferably soluble in such medium. Preferably, the useful silane is an epoxy functional silane such as beta-(3,4-epoxycyclohexyl) ethyltrimethoxysilane, 4(trimethoxysilyl) butane-1,2 epoxide or  $\gamma$ -glycidoxypropyl-trimethoxysilane.

Finally, the anti-corrosion coating compositions according to the invention may also contain, in addition to the aforementioned organic solvent, up to a maximum amount of approximately 10% by weight of white spirit so as to improve the ability of the anti-corrosion compositions to be applied to the metal parts by spraying, dipping or dip-spinning.

Advantageously, the composition may also contain a silicate of sodium, potassium or lithium, preferably in an amount comprised between 0,05 % to 0,5 % by weight.

Naturally, the present invention also relates to anti-corrosion coatings which are applied to the metal parts using the aforementioned compositions, being applied by spraying, spinning or dip-spinning followed by a curing operation at a temperature of between 70°C and 350°C for a cure time of around 30 minutes.

According to an advantageous embodiment, the anti-corrosion coating will result from an application operation involving, prior to the curing operation, an operation of drying the coated metal parts, preferably at a temperature of around 70°C for approximately 20 minutes. Under these conditions, the thickness of the coating thus applied is between 3  $\mu\text{m}$  and 15  $\mu\text{m}$  and preferably between 5  $\mu\text{m}$  and 10  $\mu\text{m}$ .

In the examples presented hereinbelow for comparative purposes, various types of corrosion inhibitor were tested within the context of the present study, which was carried out in order to improve the anti-corrosion properties of various compositions and in particular of the reference composition called GEOMET<sup>®</sup> which has been described in

- 6 -

US 5 868 819 herein incorporated by reference.

These were the main commercially available corrosion inhibitors. They have been listed below by broad chemical category, specifying each time the origin of the product together with its name and its composition.

white spirit : zinc 31129/93 of ECKART WERKE ;

\*\* Lamellar aluminium in the form of an approximately 70%  
25 paste in DPG : CHROMAL VIII<sup>®</sup> of ECKART WERKE.

- 9 -

To carry out the various comparative experiments on the  
aforementioned inhibitors, different baths were obtained by  
adding 1 g of inhibitor to 9 ml of water, the dispersion  
being maintained for 1 hour, then the mixture was added to  
5 90 g of the aforementioned standard GEOMET<sup>®</sup> composition and  
then stirred for 3 hours.

The first layer of this composition to be tested was applied  
using a No. 38 Conway bar. The drying was carried out at 70°C  
10 for approximately 20 minutes and then the curing was carried  
out at 300°C for approximately 30 minutes.

The second layer was applied using an identical protocol.

15 The panels thus treated were then tested in a salt spray. The  
salt spray resistance results for the various coatings tested  
are given in the table below.

TABLE 1

In addition, the more particular salt spray resistance results as a function of the age of the bath, and therefore of its stability at 4°C and 20°C respectively, are given in the appended Figures 1 and 2.

Both these figures show very clearly that, in each case, on the one hand, the anti-corrosion performance of the composition containing molybdenum oxide MoO<sub>3</sub> is markedly improved and that, on the other hand, the anti-corrosion performance is maintained better over time when molybdenum oxide is added to the composition.

## EXAMPLE 2

Two other types of comparative experiments were carried out, one on a GEOMET<sup>®</sup> composition and the other on a DACROMET<sup>®</sup> composition based on hexavalent chromium.

The formulations of these compositions are given in the tables below.

- 11 -

\* Lamellar zinc in the form of an approximately 95% paste in white spirit : Zinc 31129/93 of ECKART WERKE ;

\*\* Lamellar Aluminium in the form of an approximately 70% paste in DPG : CHROMAL VIII® of ECKART WERKE.

10

\*\*\* MoO<sub>3</sub> : POR from CLIMAX Company

REMCOPAL®: nonionic surfactants.

It should be noted that the molybdenum oxide powder was each time introduced into the GEOMET® or DACROMET® bath by dusting.

15

The bath was homogenized by stirring using a dispersive blade at 450 revolutions per minute.

20

The anti-corrosion compositions tested were applied to 10 cm x 20 cm cold rolled low carbon steel panels by coating using the Conway bar, followed by predrying at 70°C during about 20 minutes, and then cured in an oven at 300°C for 30 minutes.

In the case of application to screws, the compositions were applied by dip-spinning and then cured under the same conditions as for the panels.

- 5 The observed salt spray resistance results according to the ISO 9227 standard are given schematically in the following table:

TABLE 4

10

PRODUCT	SUBSTRATE	Coating weight**	Salt spray resistance*	
			Without MoO <sub>3</sub>	With 2% MoO <sub>3</sub>
Aqueous GEOMET®	Panels	32	288	> 840
Aqueous GEOMET®	Screws	30	144	504
DACROMET®	Screws	24	600	744

\* Number of hours of exposure to salt spray before red rust appears.

- 15 \*\* grams per square meter of coated surface, the thickness of the coatings are comprised between approximately about 6µm and about 8µm.

20 It is therefore apparent that introducing molybdenum oxide MoO<sub>3</sub> into compositions in aqueous phase, GEOMET® or DACROMET® containing particulate zinc, improves the salt spray resistance of the said compositions very substantially.

25 Another aspect of the invention consists in adding an alkaline silicate to the composition in an amount comprised between 0,05 % to 0,5 % by weight.

- 14 -

The addition of alkaline silicate, for example sodium silicate, surprisingly enhances the film cohesion in a worthy way.

- 5 This is particularly illustrated in the following comparative example given in Table 5.

### EXAMPLE 3

- 10 In this example, the cohesion is evaluated by applying a transparent adhesive paper on the coating surface and by quick pulling off. The cohesion is evaluated according to a scale from 0 (complete pulling off of the coating film) to 5 (no pulling off at all of the coating film).

15

TABLE 5

Raw materials	Composition without silicate (concentrations in %)	Composition with silicate (concentrations in %)
Deionized water	38,13	37,96
Dipropylene glycol	10,08	10,08
Boric acid	0,64	0,64
Sympéronic NP4®	1,48	1,48
Sympéronic NP9®	1,61	1,61
Silane A187®	8,47	8,47
Zinc 31129/93	31,48	31,48
Aluminium CHROMAL VIII®	4,98	4,98

MoO <sub>3</sub>	1	1
Silicate of sodium grade 42	0	0,17
Xanthan gum (1)	0,7	0,7

- (1) Thickening agent in order to control the viscosity of the composition during application

The composition is applied onto steel panels which have previously been degreased, with a Conway rod, in order to obtain a weight of a coating layer of 30 g/m<sup>2</sup>. The plates are  
5 then cured under the same conditions as previously described.

They are then submitted to the salt spray test according to ISO 9227 and to the cohesion test. The results are shown in following Table 6.

10

TABLE 6

	Without alkaline silicate	With alkaline silicate
<b>Salt spray</b> (number of hours before appearance of red rust)	694	720
<b>Cohesion</b>	1/5	5/5

This table shows that even if the resistance to the cohesion is not significantly modified, the cohesion on the contrary,  
15 is highly improved.

## CLAIMS

1. Use of  $\text{MoO}_3$  as an agent for enhancing the anti-corrosion properties of an anti-corrosion coating composition based on a particulate metal containing zinc or a zinc alloy in aqueous phase.
2. Use according to Claim 1 for improving the effectiveness of the sacrificial protection exerted by the particulate metal, preferably used in a lamellar form.
3. Use according to Claims 1 or 2, characterized in that the anti-corrosion coating composition contains from 30 % to 60 % of water by weight.
4. Use according to one of Claims 1 to 3, characterized in that the anti-corrosion coating composition contains a silane-based binder, preferably carrying epoxy functional groups.
5. Use according to one of Claims 1 to 4, characterized in that the molybdenum oxide  $\text{MoO}_3$  is in an essentially pure orthorhombic crystalline form, having a molybdenum content greater than approximately 60% by mass.
6. Use according to one of Claims 1 to 5, characterized in that the molybdenum oxide  $\text{MoO}_3$  is in the form of particles having dimensions of between 1 and 200  $\mu\text{m}$ .
7. Use according to one of Claims 1 to 6 characterized in that the anti-corrosion coating composition contains a silicate of sodium, potassium or lithium, preferably in an amount comprised between 0,05 % and 0,5 % by weight.
8. Anti-corrosion coating composition for metal parts, characterized in that it comprises:
  - at least one particulate metal;
  - an organic solvent;

- 17 -

- a thickener;
  - a silane-based binder, preferably carrying epoxy functional groups;
  - molybdenum oxide ( $\text{MoO}_3$ );
  - 5      - possibly a silicate of sodium, potassium or lithium, and ;
  - water.
9. Anti-corrosion coating composition for metal parts  
10      according to Claim 8, characterized in that it contains from 0.5% to 7% and preferably approximately 2% by weight of molybdenum oxide ( $\text{MoO}_3$ ).
10. Anti-corrosion coating composition for metal parts  
15      according to Claim 8, characterized in that it contains from 10% to 40% by weight of at least one particulate metal.
11. Anti-corrosion coating composition for metal parts  
20      according to one of Claims 8 to 10, characterized in that the particulate metal is chosen from zinc, aluminium, chromium, manganese, nickel, titanium, their alloys and intermetallic compounds, and mixtures thereof.
- 25      12. Anti-corrosion coating composition for metal parts according to Claims 8 to 11, characterized in that the particulate metal is chosen from lamellar zinc and/or lamellar aluminium, and preferably comprises lamellar  
30      zinc.
13. Anti-corrosion coating composition for metal parts according to Claims 8 to 12, characterized in that the organic solvent is present in an amount of 1% to 30% by  
35      weight with respect to the total composition.
14. Anti-corrosion coating composition for metal parts according to Claim 12, characterized in that the organic

- 18 -

solvent is a glycol ether, in particular diethylene glycol, triethylene glycol and dipropylene glycol.

15. Anti-corrosion coating composition for metal parts  
5 according to Claims 8 to 14, characterized in that it contains from 0.005% to 2% by weight of a thickening agent, in particular of a cellulose derivative, more particularly hydroxymethylcellulose, hydroxyethylcellulose, hydroxypropylcellulose, hydroxypropylmethylcellulose, xanthan gum or an  
10 associative thickener of the polyurethane or acrylic type.
16. Anti-corrosion coating composition for metal parts  
15 according to one of Claims 8 to 15, characterized in that it contains from 3% to 20% by weight of silane.
17. Anti-corrosion coating composition for metal parts  
20 according to one of Claims 8 to 16, characterized in that the silane comprises  $\gamma$ -glycidoxypropyl-trimethoxysilane.
18. Anti-corrosion coating composition for metal parts  
25 according to one of Claims 8 to 17, characterized in that the organic solvent furthermore contains up to approximately 10% by weight of white spirit.
19. Anti-corrosion coating composition for metal parts  
30 according to one of Claims 8 to 18, characterized in that it contains approximately 30% to 60% by weight of water.
20. Anti-corrosion coating for metal parts, characterized in  
35 that it is obtained from a coating composition according to one of Claims 8 to 19 by spraying, dipping or dip-spinning, the coating layer being subjected to a curing operation preferably carried out at a temperature of between 70°C and 350°C.

21. Anti-corrosion coating for metal parts according to Claim 20, characterized in that the curing operation is carried out for approximately 30 minutes.
- 5
22. Anti-corrosion coating for metal parts according to Claim 20, characterized in that prior to the curing operation the coated metal parts are subjected to a drying operation, preferably at a temperature of around
- 10 70°C for approximately 20 minutes.
23. Anti-corrosion coating for metal parts according to one of Claims 20 to 22, characterized in that it is applied to the metal parts to be protected with a thickness of
- 15 between 3 and 15  $\mu\text{m}$  and preferably between 5 and 10  $\mu\text{m}$ .
24. A coated metal substrate provided with an anti-corrosion coating according to one of claims 20 to 23.
